

1. Website Name.

2. Is it responsive?

Yes, YouTube is responsive, but it uses a dynamic layout system rather than standard fluid CSS rules.

When you test YouTube using DevTools (**F12**), here is what you'll notice depending on how you test it:

1. Resizing the Desktop Browser Window

If you just grab the edge of the DevTools pane and drag it around:

- **Grid Adjustment:** YouTube uses CSS Grid and Flexbox to dynamically shift the video grid (e.g., dropping from 5 columns down to 4, 3, 2, or 1 as the screen gets narrower).
- **Collapsing Sidebar:** The left sidebar automatically collapses into a mini "icon-only" bar or disappears into a hamburger menu to save horizontal space.

2. Switching to Mobile Device Mode (**Ctrl + Shift + M / Cmd + Shift + M**)

If you toggle DevTools' **Device Toolbar** to simulate a smartphone (like an iPhone or Pixel):

- **Initial View:** If you just switch the view, it might look like a squished desktop version at first.

- **Why this happens:** YouTube serves a completely different mobile-optimized web application on m.youtube.com.
- **Fixing it in DevTools:** Once you toggle mobile device view, **refresh the page (F5 or Ctrl + R)**. YouTube will detect the mobile user agent, redirect to m.youtube.com, and load the fully responsive mobile UI!

3. What Changes on the Desktop?

When you view YouTube on a **mobile browser layout** (or simulate a mobile device in DevTools), the entire interface shifts to a streamlined, touch-first design (m.youtube.com).

Here are the key changes that happen on mobile:

Key Mobile Layout Changes

1. **Single-Column Feed:** The multi-column video grid disappears completely. On mobile, videos are stacked in a single vertical column, featuring full-width thumbnails for easy vertical scrolling.
2. **Bottom Navigation Bar:** The desktop side menu is replaced by a persistent navigation bar fixed at the bottom of the screen (featuring icons for *Home*, *Shorts*, *Subscriptions*, and *You*), placing key tabs within thumb reach.
3. **Compact Header:**
 - The search bar is hidden behind a simple **magnifying glass icon** to save screen real estate. Tapping it opens a dedicated search overlay.
 - The desktop logo shrinks, and unnecessary top header elements are removed.
4. **Touch-Optimized Video Watch Page:**
 - **Player First:** The video player automatically fills the top portion of the viewport width.
 - **Collapsible Details:** Description boxes, comments, and action buttons (*Like*, *Share*, *Save*) switch to horizontal scrollable rows or collapsible drawers so they don't clog up screen space.
 - **Autoplay Next:** Suggested videos load directly beneath the player in a single vertical list.
5. **Shorts Focus:** YouTube Shorts are optimized to automatically snap to full-screen vertical view (9:16 ratio) with vertical swipe gestures for switching videos.
6. **Touch Targets & Gestures:** Buttons (like play/pause, like, and share) are enlarged for finger taps rather than precise mouse hovers. Features like double-tapping the left/right side of the video player to seek backward/forward 10 seconds become active.

4. What Changes on the Desktop?

When you resize YouTube on a **desktop browser screen**, the layout dynamically adapts at specific width breakpoints. Here are the main changes that happen as the window gets smaller:

Key Desktop Layout Changes

- **Video Grid Columns:** The home page grid automatically reduces its column count. On a widescreen monitor, you might see 5 or 6 video cards per row, which scales down to 4, 3, 2, and eventually 1 as the viewport shrinks.
- **Navigation Sidebar:**
 - **Expanded View (Wide):** Shows the full navigation menu with text labels (Home, Shorts, Subscriptions, Library, etc.).
 - **Collapsed View (Medium/Narrow):** Shrinks into a slim vertical bar displaying only icons to preserve space for video thumbnails.
 - **Hidden View (Very Narrow):** Hides entirely into a hamburger menu button (☰) at the top left.
- **Search Bar & Top Navigation:** The search bar and voice search icon shrink in width. On narrower desktop widths, the search bar compresses, and extra header icons (like *Create* or *Notifications*) may combine or hide.
- **Watch Page (Video View):**
 - **Wide Screens:** Displays the main video player and details on the left, with recommended videos stacked in a side column on the right.
 - **Narrow Screens:** Pushes the recommended video list **below** the video player and comments section to maintain readable text and adequate player size.
- **Thumbnail & Text Scaling:** Video thumbnails scale down proportionally, and titles trim short with ellipses (...) so card heights remain uniform across rows.

5. What do you like about the design?

- The design is very nice as it adjusts when you try it on the desktop especially when you are trying to check the front end of the website that you are working on.

6. Screenshot Desktop.

7. Screenshot Mobile.
